PDF Security

Appligent's security components allow you to easily add encryption or digital signatures to a single or multiple PDF documents using Acrobat standard security mechanisms. You will be able to make sure no one changes the content of your file, or copies your images from within it. You can password protect files to make sure only the people you authorize can see or edit the content.

These security products are server-based, making it is easy to apply digital signatures and encryption to large volumes of documents automatically. This eliminates the step of manually opening up each file in Acrobat to add the protection you need or simply doing without it and hope the integrity of your files stays intact.

Appligent's security components can be accessed as Web Services via SOAP (requires APConductor) or scripted as command line tools.

SecurSign

SecurSign is a server-based software component that complies with cryptographic standards and enables users to electronically "sign" documents to assure their authenticity. In addition it encrypts files to restrict the end user's ability to edit, copy or print documents.

- No additional plug-ins are required
- Apply multiple visible or invisible signatures to a document or a collection of documents
- Linearize output

Price: \$2495.00 (USD) per server. Development licenses are available at a 50% discount.
